**FlexITy Solutions Achieves Cisco Powered Designations in
Managed Unified Communications, Managed Connectivity**

Richmond Hill, Ontario – 15th April 2008 – FlexITy Solutions announced today that it has been awarded the following Cisco® Powered Managed Unified Communications and Managed Connectivity designations from Cisco. These designations recognizes FlexITy for having worked to acquire the resources and establish the procedures to deploy, manage and support these managed services in all specified locations.

Peter Stavropoulos, CEO of FlexITy, said: “Meeting the criteria to achieve Cisco’s Managed Services Channel Partner certification reflects the commitment and expertise within FlexITy. It also demonstrates our ability to combine Cisco solutions with our Managed Services to create and deliver high value solutions to our customers. This achievement demonstrates FlexITy’s ability to combine Cisco solutions with their services to create and deliver high-value Managed Service offerings to our customers.”

“Adopting managed services allows companies to align IT and business goals, enabling them to focus scarce internal resources on their core competencies while servicing day-to-day IT infrastructure and operational needs through technology delivered as a service. More of our partners are fulfilling this market need by delivering flexible services based on Cisco Internet Protocol Next-Generation Networks,” said Jeff Spagnola, vice president of worldwide service provider marketing at Cisco. “Based on a consistent, global framework, Cisco Powered designations indicate that FlexITy Solutions has made an investment in obtaining the training, skills and knowledge necessary to play a pivotal role in meeting this increasing demand.”

- **A Cisco Powered Managed Unified Communications** business communications service is designed to provide unified voice, video, data and mobility communications

for the business environment. The service integrates voice, video, and other collaborative data applications into intelligent network communications solutions. These solutions, including Internet Protocol (IP) telephony, unified communications, and rich-media conferencing, take full advantage of the power, resilience and flexibility of an organization's unified communications network.

- **A Cisco Powered Managed Connectivity** Internet service delivers highly secure Internet connectivity. This service is based on the Cisco Self-Defending Network architecture and is built upon industry leading security for the network infrastructure. The service delivers connectivity for users regardless of location and access methods. It is backed by comprehensive service-level agreements (SLAs) covering the overall performance of the service, and online access to real-time and historical service-performance reports.

Cisco Powered Managed Service designation requirements are based on the Information Technology Infrastructure Library® (ITIL) framework of best practices as well as market and industry requirements. FlexITy Solutions also passed a rigorous assessment of its network operation center as a part of the Managed Service Channel Program process.

Cisco recommends services that are designated Cisco Powered because they are designed to deliver a high-quality, customizable service experience, making it easier for businesses to make the right decision when purchasing technology as a service.
